**DETAILED ACTION**

***Allowable Subject Matter***

1. Claims 1, 3, 4, 7-9, 11-14, 16-19, and 23 are allowed.

The following is an examiner's statement of reasons for allowance:

Regarding claim 1, prior art fails to teach or make obvious a line light irradiation device for use in product inspection comprising: multiple light emitting parts; wherein a optical fiber band comprises a light irradiating part formed by arranging light leading out end portions of multiple optical fibers in a straight line or in multiple straight lines and a columnar lens is arranged to extend along a direction of the straight line in front of the light irradiating part in pairs, and that irradiate line light; wherein the light emitting parts are of a same shape and predetermined lengths of the multiple optical fibers of the optical fiber band are made to be different so that the binding part is located to deviate to either one of two directions with respect to a center line of the light irradiating part and two identical optical fiber bands are mounted with their front and back sides turned upside down in the holding body so that the location of each adjacent binding part is different and the multiple light emitting parts are arranged serially along the above mentioned direction of the straight line and the multiple light sources are arranged along the above mentioned direction of the straight line on the holding body and wherein each light emitting part is arranged on the holding body so that the optical axis of the line light irradiated from each light emitting part is arranged radially viewed from the above-mentioned direction of the line.

Regarding claim 13, prior art fails to teach or make obvious a line light irradiation device comprising: multiple light sources; multiple light emitting parts, each of which is arranged in a line with light leading out end portions of respective multiple optical fibers for forming a straight

line of a predetermined width, and portions of the multiple optical fibers between the light introducing end portions and the light leading out portions are formed as a sheet form, and each of the multiple light emitting parts is arranged on the holding body so that the optical axis of the line light irradiated from each light emitting part is arranged radially viewed from the above-mentioned direction of the line; a plurality of columnar lens, each arranged to extend along a direction of a respective line in front of each of the light irradiating parts, and to converge light onto the straight line; a holding body holds the light emitting parts so that each optical axis of light irradiated from each of the light emitting parts crosses at a predetermined straight line, and the multiple light emitting parts are of a same shape, and binding parts that are formed by binding each of the respective light introducing end portions of the optical fibers in the substantially cylindrical form, wherein each length of the optical fibers of all or a part of the optical fibers are different so that the binding part is located to deviate to either one of two directions in a plane view with respect to a center line of the light irradiating part and the respective adjacent binding parts are configured to alternate in deviation to enable adjacent optical fibers to spread into linear arrays that are turned upside down from each other to provide a stacked compact configuration, and the multiple light sources are arranged along the direction of the straight line on the holding body.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
